

NGO MANAGEMENT SYSTEM USING BLOCKCHAIN

Abstract:

The NGO Management System using Blockchain is a secure and transparent web-based application designed to improve the management of donations and expenditures in Non-Governmental Organizations (NGOs). Traditional NGO management systems often face challenges such as data manipulation, fraud, and lack of transparency, which can reduce donor trust. This system leverages blockchain technology to maintain an immutable and tamper-proof record of all donations and expenditure transactions. The application consists of three users: Admin, NGO, and Donor. The admin registers and manages NGOs; donors can contribute funds and track how their donations are utilized, and NGOs can record expenditures and manage received donations. Every transaction is securely stored on the blockchain, ensuring that any unauthorized modification can be easily detected by all stakeholders. By providing transparent financial records, secure transaction management, and real-time verification of data integrity, the system enhances accountability, prevents fraudulent activities, increases donor confidence, and promotes efficient and trustworthy management of NGO funds.

Objectives:

- To develop a secure and transparent blockchain-based NGO management system that enables efficient management of NGOs, donors, fundraising campaigns, and donations while ensuring only verified NGOs participate in the platform.
- To ensure secure and tamper-proof management of donations and expenditures by recording transactions using Solidity smart contracts on the Ethereum blockchain and storing supporting documents securely on IPFS with integrity verification.
- To enhance transparency, accountability, and donor trust by enabling real-time donation tracking, expenditure verification, QR code-based document verification, and comprehensive dashboards for all stakeholders.
